Project1

🕐 Due October 31 at 11:00 PM   🕐 Starts Oct 12, 2020 10:00 AM

In this project, you will combine the exercises you have completed so far into one solution. Specifically, combine Assign03 (Week 3), Assign04 (Week 4), and Assign05 into one larger project.

- Video Introduction: https://youtu.be/va4Rp8ioWqE

- Create a Project1 folder in your server share space to store your solution into.

- Use different images. None of the images that you used in completing Assign03, Assign04, or Assign05 should be used in this project. This project should contain new images and look different from your previous assignments.

- You cannot use 8 images on the hover part. There must be a minimum of 6, but no maximum. This means you will have to change the code of that assignment in order to make it work properly.

- You cannot use 7 images in the slider part. There must be a minimum of 6, but no maximum. This means you will have to change the code of that assignment in order to make it work properly.

- My example images below do not use categories, but your solution must use categories. For my example images, I simply pieced together shots of your assignments. You will turn each image of the landing page / main image selection into a category of images. Following that image will take you to more images of that kind.
  - For example, your hover might have 10 different basketball teams and clicking one of them would take you to the slider with 12 images of that specific team.

Examples to start your creative juices flowing:

As an idea, you could have your landing page contain an image slider. Each image in the image slider is a category of that type of image. Clicking on that image, or some other element you put in place, would send you to a page of thumbs (hover exercise) of that category. You could then navigate back to the image slider and subsequently into another category. Either of those could have an "ad" (doesn't actually have to be an ad, it can be something relevant to your assignment) and fixed elements.

You could also do the reverse where your landing page is made up of thumbs (hover exercise) and clicking a thumb takes you to an image slider containing more of that category of images.

Another idea is to have just one page where the slider takes up the top area (as it often does when you see it used) and the lower portion contains the hover images. Clicking an image within the slider would change the lower thumbs that you hover over. Again the page would have an "ad" style box for something and also fixed elements.

Grading

Includes Hover Over Images (Assign03)	10 pts
Includes "ad" and fixed element(s) (Assign04)	10 pts
Includes Sliding Images (Assign05)	10 pts
Functionality - Hover over images works correctly - "ad" and fixed elements work correctly - Sliding images works correctly - Functionality in general works correctly - Followed directions correctly	40 pts
Aesthetics	30 pts
Total	**100 pts**
